

The power company here in New Jersey cannot handle the current workload to their aging and overloaded network now. Takes months just to get a simple RFI complaint resolved. How will they possibly respond to the deluge of rf interference complaints that are going to be generated by mixing high speed data into a non-linear power grid system that is essentially the largest antenna system in the world? Will probably be the world's largest interference generator with no one qualified to maintain it. Who would field the complaints against them? The FCC? In my opinion there are plenty of alternatives out there and this one is just a powder keg ready to explode. Yours truly, Peter Pellack
